About the Celestial Objects

Listed on this page are several of the brighter, more interesting celestial objects visible in the evening sky this month (refer to the monthly sky map). The objects are grouped into three categories. Those that can be easily seen with the naked eye (that is, without optical aid), those easily seen with binoculars, and those requiring a telescope to be appreciated. **Note, all of the objects (except single stars) will appear more impressive when viewed through a telescope or very large binoculars.** They are grouped in this way to highlight objects that can be seen using the optical equipment that may be available to the star gazer.

Tips for Observing the Night Sky

When observing the night sky, and in particular deep-sky objects such as star clusters, nebulae, and galaxies, it's always best to observe from a dark location. Avoid direct light from street lights and other sources. If possible observe from a dark location away from the light pollution that surrounds many of today's large cities.

You will see more stars after your eyes adapt to the darkness—usually about 10 to 20 minutes after you go outside. Also, if you need to use a torch to view the sky map, cover the light bulb with red cellophane. This will preserve your dark vision.

Finally, even though the Moon is one of the most stunning objects to view through a telescope, its light is so bright that it brightens the sky and makes many of the fainter objects very difficult to see. So try to observe the evening sky on moonless nights around either New Moon or Last Quarter.

Astronomical Glossary

Conjunction – An alignment of two celestial bodies such that they present the least angular separation as viewed from Earth.

Constellation – A defined area of the sky containing a star pattern.

Diffuse Nebula - A cloud of gas illuminated by nearby stars.

Double Star – Two stars that appear close to each other in the sky; either linked by gravity so that they orbit each other (binary star) or lying at different distances from Earth (optical double). Apparent separation of stars is given in seconds of arc (").

Ecliptic – The path of the Sun's center on the celestial sphere as seen from Earth.

Elongation – The angular separation of two celestial bodies. For Mercury and Venus the greatest elongation occurs when they are at their most angular distance from the Sun as viewed from Earth.

Galaxy - A mass of up to several billion stars held together by gravity.

Globular Star Cluster – A ball-shaped group of several thousand old stars.

Light Year (ly) – The distance a beam of light travels at 300,000 km/sec in one year.

Magnitude – The brightness of a celestial object as it appears in the sky.

Open Star Cluster – A group of tens or hundreds of relatively young stars.

Opposition – When a celestial body is opposite the Sun in the sky.

Planetary Nebula – The remnants of a shell of gas blown off by a star.

Universal Time (UT) – A time system used by astronomers. USA Eastern Standard Time (for example, New York) is 5 hours behind UT.

Variable Star - A star that changes brightness over a period of time.

NORTHERN HEMISPHERE JUNE 2007 Altair Aql Arcturus Boo δ Cephei Cep Deneb Cvq α Herculis Her Regulus Leo Vega Lvr Antares Sco Polaris UMi Spica Vir **OBJECTS LESTIAL** (**J**maps 13 \$3 ☆

Easily Seen with the Naked Eye Altair Aql • Brightest star in Aquila. Name means "the flying eagle". Dist=16.8 ly. Arcturus Boo • Orange, giant K star. Name means "bear watcher". Dist=37 ly.

- orange, giant K star. Name means bear watcher . Dist=37 (y.
 Cep e. Cepheid prototype. Mag varies between 3.5 & 4.4 over 5.366 days. Mag 6 companion.
 Cyg e. Brightest star in Cygnus. One of the greatest known supergiants. Dist=3,000 ly.
 Her e. Semi-regular variable. Magnitude varies between 3.1 & 3.9 over 90 days. Mag 5.4 companion.
 Leo e. Brightest star in Leo. A blue-white star with at least 1 companion. Dist=77 ly.
 - The 5th brightest star in the sky. A blue-white star. Dist=25.3 ly.
 - Sco Red, supergiant star. Name means "rival of Mars". Dist=135.9 ly.
 - UMi The North Pole Star. A telescope reveals an unrelated mag 8 companion star.

Vir • Latin name means "ear of wheat" and shown held in Virgo's left hand. Dist=260 ly.

Easily Seen with Binoculars

η Aquilae M3	Aql CVn	⊛ ⊕	Bright Cepheid variable. Mag varies between 3.6 & 4.5 over 7.166 days. Dist=1,200 ly. Easy to find in binoculars. Might be glimpsed with the naked eye.
μ Cephei	Cep	•	Herschel's Garnet Star. One of the reddest stars. Mag 3.4 to 5.1 over 730 days.
Mel 111	Com	ँ	Coma Berenices. 80 mag 5-6 stars in 5 deg. Dist=288 ly. Age=400 million years.
χ Cygni	Cyg		Long period pulsating red giant. Magnitude varies between 3.3 & 14.2 over 407 days.
M39	Cyg	ँ	May be visible to the naked eye under good conditions. Dist=900 ly.
v Draconis	Dra	•	Wide pair of white stars. One of the finest binocular pairs in the sky. Dist=100 ly.
M13	Her	•	Best globular in northern skies. Discovered by Halley in 1714. Dist=23,000 ly.
M92	Her	÷	Fainter and smaller than M13. Use a telescope to resolve its stars.
ε Lyrae	Lyr	•	Famous Double Double. Binoculars show a double star. High power reveals each a double.
R Lyrae	Lyr	۲	Semi-regular variable. Magnitude varies between 3.9 & 5.0 over 46.0 days.
M12	0ph	⊕	Close to the brighter M10. Dist=18,000 ly.
M10	Oph	÷	3 degrees from the fainter M12. Both may be glimpsed in binoculars. Dist=14,000 ly.
IC 4665	Oph	ँ	Large, scattered open cluster. Visible with binoculars.
6633	Oph	õ	Scattered open cluster. Visible with binoculars.
M8	Sqr		Lagoon Nebula. Bright nebula bisected by a dark lane. Dist=5,200 ly.
M25	Sqr	ੋ	Bright cluster located about 6 deg N of "teapot's" lid. Dist=1,900 ly.
M22	Sqr	Ð	A spectacular globular star cluster. Telescope will show stars. Dist=10,000 ly.
M4	Sco	⊕	A close globular. May just be visible without optical aid. Dist=7,000 ly.
M6	Sco	ं	Butterfly Cluster. 30+ stars in 7x binoculars. Dist=1,960 ly.
M7	Sco	ं	Superb open cluster. Visible to the naked eye. Age=260 million years. Dist=780 ly.
M5	Ser	⊕	Fine globular star cluster. Telescope will reveal individual stars. Dist=25,000 ly.
Mizar & Alcor	UMa		Good eyesight or binoculars reveals 2 stars. Not a binary. Mizar has a mag 4 companion.
Cr 399	Vul	਼	Coathanger asterism or "Brocchi's Cluster". Not a true star cluster. Dist=218 to 1,140 ly.
	Vul	0	Coathanger asterism or "Brocchi's Cluster". Not a true star cluster. Dist=218 to 1,140 ly.

Beautiful double star. Contrasting colours of orange and blue-green. Sep=34.4". Attractive double star. Contrasting colours of orange dwarfs. Dist=11.4 ly. Sep=28.4". Appear yellow & white. Mags 5.2 & 6.1 orange dwarfs. Dist=11.4 ly. Sep=28.4". Appear yellow & white. Mags 4.3 & 5.2. Dist=100 ly. Struve 2725 double in same field. Eclipsing binary. Mag varies between 3.3 & 4.3 over 12.940 days. Fainter mag 7.2 blue star. Ring Nebula. Magnificent object. Smoke-ring shape. Dist=4,100 ly. Tirfid Nebula. A telescope required to show stars. Dist=2,100 ly. Trifid Nebula. A telescope shows 3 dust lanes trisecting nebula. Dist=5,200 ly. A fine and impressive cluster. Dist=4,200 ly. Omega Nebula. Contains the star cluster NGC 6618. Dist=4,900 ly. Wild Duck Cluster. Resembles a globular through binoculars. V-shaped. Dist=5,600 ly. Eagle Nebula. Requires a telescope of large aperture. Dist=8,150 ly. Beautiful spiral galaxy visible with binoculars. Easy to see in a telescope. Close to M81 but much fainter and smaller.
